A functional block diagram, in systems engineering and software engineering, is a block diagram. It describes the functions and interrelationships of a system. The functional block diagram can picture:

A functional flow block diagram (FFBD) is a multi-tier, time-sequenced, step-by-step flow diagram of a system's functional flow. The term "functional" in this context is different from its use in functional programming or in mathematics, where pairing "functional" with "flow" would be ambiguous. Here,

already know something also called function block diagrams. PLC function block diagram is not that different from it. What FBD offers is a way to put functions written with many lines of code into boxes. Thereby we can easily connect them, to make a bigger PLC program. As with ladder logic and structured text,

It is also known as a context diagram. Functional flow block diagrams are usually made using a number of different levels.

A Functional Flow Block Diagram is a popular graphical method. It uses a rectangular box to represent each function (Figure 4.1-1). Arrows represent flows or states of any type to and from the function. The flows connect to other functions or to outside the system.

The basic elements of a block diagram are a block, the summing point and the take-off point. Let us consider the block diagram of a closed loop control system as shown in the following figure to identify these elements. The above block diagram consists of two blocks having transfer functions $G(s)$ and $H(s)$.
