The first textbook for the course, and still the market leader, Cognitive Neuroscience has been thoroughly refreshed, rethought, and reorganized to enhance students' and instructors' experience. A stunning, all new art program conveys data and concepts clearly, and new chapter-opening Anatomical Orientation figures help students get their bearings. The table of contents and the chapters themselves have been reorganized to improve the logical flow of the narrative, and the world renowned author team has kept the book fully up to date on the latest research in this fast moving field.

Modeled on the classic Neuroscience Study Program volumes which helped define an evolving field, The Cognitive Neurosciences is a major new reference that documents and defines the emerging field of cognitive neuroscience. The ninety-two original contributions provide comprehensive coverage - from the molecular level right up to human conscious experience - of one of the most interesting areas of modern science, namely the relationship between the structural and physiological mechanisms of the brain/nervous system and the psychological reality of mind. "Sections and section editors": Molecular and Cellular Plasticity, Ira Black. Neural and Psychological Development, Pasko Rakic. Sensory Systems, Colin Blakemore and J. Anthony Movshon. Strategies and Planning: Motor Systems, Emilio Bizzi. Attention, Michael Posner. Memory, Endel Tulving. Language, Steven Pinker. Thought and Imagery, Stephen M. Kosslyn. Emotion, Joseph E. LeDoux. Evolutionary Perspectives, Leda Cosmides and John Tooby. Consciousness, Daniel L. Schacter. "An extremely valuable handbook. Not only is its scope adequate to the challenge of this rapidly growing young discipline, but the focus is clear: intelligible, up-to-date theories of mental processes are grounded in the latest findings of the brain sciences. The integration provided in this handbook lays a foundation for the next generation of cognitive neuroscientists." -- George A. Miller, James S. McDonnell Distinguished University Professor of Psychology Emeritus, Princeton University. "The Cognitive Neurosciences" is a wonderfully comprehensive and up-to-date collection of authoritative articles. I strongly recommend it to anyone who hopes to keep abreast with this fast-moving area of scientific enquiry--relating the brain and mind." -- Sir Roger Penrose, FRS, Rouse Ball, Professor of Mathematics, University of Oxford. "At last--a source book in Cognitive Neuroscience for our students! And for ourselves! This much needed book contains a thoughtful selection of reviews from all areas relevant to current research. [...] Michael Gazzaniga and his colleagues should be congratulated for an outstanding job." -- Eric R. Kandel, M.D. University Professor, Center for Neurobiology, Columbia University A Bradford Book

Cognitive Neuroscience: A Reader provides the first definitive collection of readings in this burgeoning area of study.

Written by world-renowned researchers, including Michael Gazzaniga, Cognitive Neuroscience remains the gold standard in its field, showcasing the latest discoveries and clinical applications. In its new Fifth Edition, updated material is woven into the narrative of each chapter and featured in new Hot Science and Lessons from the Clinic sections. The presentation is also more accessible and focused as the result of Anatomical Orientation figures, Take-Home Message features, and streamlined chapter openers.

The fourth edition of the work that defines the field of cognitive neuroscience, offering completely new material.

The ability to selectively attend to events in the world around us is a core cognitive function. It prevents distraction and enables humans and animals to dedicate perceptual, cognitive, and motor resources to deal with the most pressing current challenges. When attention systems of the brain are damaged by disease or trauma, the impact for the individual and society can be significant, and therefore, understanding the neural mechanisms of attention is a central goal in neuroscience. In addition, understanding how attention mechanisms operate is critical for advancing the important mission of developing the most effective training regimes for a wide range of duties, as well as for creating new methods for educating the world's growing population. This text addresses the basic neuroscience of how the brain controls the focus of attention, and how this focused attention influences sensory and motor processes. This volume will provide the reader with a selection of the models, mechanisms and findings in the neuroscience of attentional control and selection from leading authorities working in human and animal models, and incorporating a array of neuroscience methods from single neuron recordings to functional brain imaging, and advanced modeling. The book begins with contributions that describe attentional selection, relying largely on evidence from attention in vision. Subsequent chapters address attentional control mechanisms in cortical and subcortical brain networks. Finally, the role of attention in action, short-term memory, and emotion are discussed.

This volume, which contains forty-six review articles from recent issues of Current Opinion in Neurobiology, provides easy access to the current state of theory and findings in the field.

A summation of research on the structure and function of the brain presents new ideas on how the human mind evolved in adaptation to a world that no longer exists
