Basic Operation
of a Jet Engine

Read Free Jet Engines Theory

- The basic operation of a jet engine is: - Air enters and is compressed in a compressor. - Fuel is then added and ignited. - The resulting gas spins a turbine, - The turbine powers the compressor. -

The gas then exits the engine at the tailpipe.

- The way a jet engine operates is similar to the way an

Liquid-cooled engines jacket the cylinders and cylinder heads with water. Heat is absorbed by the water, which is pumped to a radiator where

jet engine, the engine burns fuel (like kerosene) with air from the atmosphere. The burning fuel heats and expands the air, and this hot air shoots out of the exhaust-end of the engine to create thrust.
