## **Solutions Are Always Homogeneous**

A solution is always a homogeneous mixture—that is, every part of the mixture is exactly like every other part.

Solutions are formed by dissolving one substance, called the solute, in another substance, known as the solvent.

## **Solutions Are Always Homogeneous**

The general solution of the homogeneous system is the set of all possible solutions, that is, the set of all that satisfy the system of equations. We already know that, if the system has a solution, then we can arbitrarily choose the values of the non-

# Where To Download

basic variables and then find, by the back-substitution algorithm, the values of the basic variables that solve the system.

Solutions Are  
Always  
Homogeneous

On a more microscopic scale, you could call the suspended micelles phase boundaries, and in that case might not call the mixture homogeneous.

"Solution" always implies mixing on the molecular level (single-phase).

**Are all homogeneous mixtures just**

A linear differential equation is homogeneous if it is a homogeneous linear equation in the unknown function and its derivatives. It follows that, if  $y_1(x)$  is a solution, so is  $cy_1(x)$ , for any (non-zero) constant  $c$ . In

# Where To Download

order for this condition to hold, each nonzero term of the linear differential equation must depend on the unknown function or any derivative of it.

Solutions Are  
Always  
Homogeneous

with homogeneous systems over non-homogeneous systems is that homogeneous systems always have at least one solution, namely, the case where all unknowns are equal to zero. Such a case is called the trivial solution to the homogeneous system. For instance, looking again at this system:
