~~Repair Manual~~
In the early days of fuel injection, automakers developed throttle-body fuel injection (TBI) as a cheap way to switch over to fuel injection. TBI mounts the injector (s) right in the throttle body. It ' s a single compact unit that mounts atop the intake manifold in pretty much the same way as a carburetor — hence the appeal to automakers.

pump located in the fuel tank. This pump supplies fuel pressure in sufficient volume to meet the engine's fuel requirement through all load conditions. Injector pressures range from 13 to 16 psi (low pressure system) or 35 to 60 psi (high pressure system), and are kept constant by the fuel pressure regulator.

Fuel pressure should be a constant 10 – 15 PSI on a TBI fuel injection system and is typically around 12 – 13 psi. Higher pressure than 15 psi indicates that there is an issue with the installation. Many times this is due to kinked fuel lines, improper routing of the return line and/or fuel line restrictions.

A throttle body injection, or TBI, acts
almost like a carburetor, except that
instead of relying on jets and vacuum
to regulate the amount of fuel
entering the intake, a fuel injector, or
sometimes two, is used to deliver the
correct amount of fuel to the engine.
